Kuku — AI Generalist Assignment

Welcome

Thank you for your interest in Kuku. This assignment is your chance to show us how you think and what you can build, on the kind of problem you'd actually work on here.

Kuku makes stories for audiences around the world, in many formats and languages. A large and fast-growing share of what we make today is AI-generated microdrama: short vertical series with 1 to 2-minute episodes. Problems 1 and 3 come from that work. Problem 2 comes from outside it, so it needs no context about us.

As in the job itself, there's no spec: just a messy problem and the freedom to decide what to build. Pick one problem, spend about 2 to 3 hours on it and submit within 48 hours. Use any AI tools you like.

There's no single right answer. A simple, honest submission that works and is clear about its limits will beat a polished one that overpromises. We're excited to see what you come up with.

How it works

You'll have 48 hours from the moment this brief is sent. Please submit through the form shared by your placement cell before the deadline, as we can't review late submissions.

- **Make assumptions instead of asking.** We won't be taking questions about the problems. Where something is unclear, make a sensible assumption, note it in your doc and keep going. Working with incomplete information is a big part of this job, so we'd love to see how you handle it.
- **Use AI freely, and tell us how.** ChatGPT, Claude, Gemini, Cursor, Lovable, no-code tools: anything goes, and we care about how well you use them. In your doc, tell us which tools you used and one place where they got it wrong.
- **Free tiers are enough.** You don't need to spend any money, and paid tools won't earn extra credit. If a paid API would help, tell us how you'd use it and build a smaller version for free.
- **Build something you can run again.** If you're shortlisted, you'll run your solution on a new input during your interview. We may also connect stronger models through APIs we provide, so a solution where the model is easy to swap will shine.

- **Make it your own.** Talking ideas through with friends is fine, but please build and write it yourself, and submit only work you understand.

The input pack

Everything you need for Problem 1 is in the input pack. It holds the first 50 episodes of one of our English-language shows made for US audiences:

- **Detailed screenplays**, with a timestamp for every scene, line of dialogue and key action.

Problem 2 has no input pack. For Problem 3, the pack is optional; you can bring your own public inputs instead.

Problem 1: Find the Promos (Ads)

Build a tool that reads a microdrama screenplay and finds the best promos in it.

The situation. Today an editor watches every episode and picks promo moments by hand, one show at a time, and we release new shows every week.

What we mean by a promo. A promo is a 20 to 60-second clip taken from the show itself and posted on Instagram, TikTok or YouTube to pull new viewers in. It's usually one continuous stretch, but it can also join a few moments, from one episode or across several. A good promo:

- **opens on a hook:** something in the first 3 seconds that makes a scrolling viewer stop, like a slap, a reveal or a shocking line
- **ends on a cliffhanger:** it cuts at an unresolved moment, so the viewer needs to know what happens next
- **makes sense on its own** to someone who has never seen the show

Your job is only to find these promos: the right moments, and the right start and end points. No editing, music or text overlays. For examples, look at how apps like ReelShort and DramaBox promote their shows.

Your task.

- **Find the promos across all episodes.** For each one, give the episode and the start and end timestamps of every segment, in order, plus the hook, the cliffhanger and one line on why it works.
- **Rank them.** Which promos would you post first, and why?

- **Check quality.** Where does your tool pick badly?

Problem 2: Build an AI Lawyer

Build an AI lawyer that an ordinary person in India can talk to about a legal problem.

The situation. Most people never get legal help for everyday problems: a deposit the landlord won't return, a refund that never came, salary that stopped, a notice they don't understand. A lawyer feels too expensive, the process is confusing and the paperwork is intimidating, so most people simply give up.

Your task. Build a conversational AI that takes a person's problem by text or voice, in the language they're comfortable with, and helps them act on it. What it does is up to you. Some directions to get you started:

- **Build the case:** turn a messy story into what happened, when, and what proof they have
- **Explain where they stand** and what their options are, in plain language
- **Prepare what they need,** like a legal notice, a complaint, a reply or an application
- **Help them argue,** for example by playing the other side so they can practise

You can cover one kind of problem in depth or many in breadth.

Ground rules. Your AI should be honest about what it doesn't know, say when someone needs a real lawyer. AI models confidently invent laws, sections and past cases, so tell us how yours avoids that.

There's no input pack for this problem. Write your own test cases and include them with your raw outputs.

Problem 3: Find your own problem

Pick a real problem in making, adapting or promoting AI microdramas, and build the smallest thing that helps.

Your task.

- **Find the problem and show it's real.** Watch shows on Kuku TV or other microdrama apps, study their promos, read reviews, or talk to viewers. Tell us who has the problem, how you know, and why it matters more than Problems 1 and 2.

- **Build a small working solution** with AI and code or no-code tools, using the input pack or public inputs you collect.
- **Tell us how you'd know it worked** once a real team used it.

Pick something narrow. "An AI that writes hit shows" is a great ambition, but too big for 3 hours. The right size is one person, one step of their work, and one output you can check.

What to submit

Please submit one form with your name, roll number, branch, the problem you chose and the links below. Make sure every link opens for anyone who has it.

Item	Required	Notes
Solution doc	Yes	PDF, up to 2 pages.
Prototype link	Yes	Anything we can open: a deployed app (Hugging Face Spaces, Streamlit Community Cloud and Vercel all have free tiers), a GitHub repo, a Colab notebook or a no-code workflow. If it can't be hosted, a repo with clear run steps is fine
Raw outputs	Yes	A folder of unedited outputs from running your solution: on the full input pack for Problem 1, on your own test cases for Problem 2, or on your own inputs for Problem 3
Walkthrough video	Optional, and recommended	Up to 3 minutes: a screen recording in your own voice, showing your solution running. It's the quickest way for us to see your work the way you meant it. Loom, unlisted YouTube or Drive

Your solution doc. Structure it however you think best. By the end, we'd like to know which problem you picked and why, the assumptions you made, how your solution works, how it would scale to every show we make, and how you know it's good, including where it fails.

What we look for

We look at every submission through the same five lenses, whichever problem you choose. The problem you pick, and why you picked it, is part of the evaluation too.

- **Problem choice and framing.** Why this problem, how you scoped it, and the assumptions you made where the brief was silent.
- **Approach and scale.** What you gave to AI, what you kept as code or simple rules, where a human stays in the loop, and how it holds up, and what it costs, at real-world volume.
- **Quality checking.** How you know the output is good, backed by real runs and honest failures.
- **The prototype.** It runs on real inputs and produces output someone could actually use.
- **Communication.** Clear, specific and short.

The prototype matters. Polish and length won't earn extra credit; clear thinking will.

Fine print and FAQs

- **Confidentiality.** The input pack is Kuku's own content, shared just for this assignment. You're welcome to use it with AI tools for your work, but please don't publish or share it.
- **Integrity.** Please keep your work your own. Very similar submissions from the same campus are reviewed closely.
- **One problem, one submission.** Please pick one problem and submit once; we review one submission per person.
- **Logistics help.** If a link breaks or the form won't load, write to [logistics contact] and we'll sort it out. For the problems themselves, go with your best assumptions.

I'm not from computer science. Can I still do well? Absolutely. No-code tools and careful prompting are fine. We judge the thinking and whether it works, not your code or your branch.

My prototype only half works. Should I still submit? Yes, please. Tell us what works, what doesn't and why. An honest partial solution often beats an overstated complete one.

Can AI write my solution doc? It can help, but the decisions should be yours. We'll talk through them in your interview.

For Problem 2, does my AI lawyer need to know all of Indian law? No. Pick the problems that matter most to the people you're building for and handle them well. Tell us what it covers and what it doesn't.

Thank you for your time. We know placement season is busy, and we're grateful you're spending some of it with us. Good luck, and enjoy it.
